Research Interests

Broadly speaking, my research interests lie with artificial intelligence and machine learning, while having a focus on probabilistic programming. My overarching scientific goal is to develop systems that are capable of reasoning and learning with raw sensor data. In order to achieve this, I believe in the necessity of a holistic approach, which is also reflected in my specific research activities – ranging from probabilistic inference with discrete and continuous variables [5, 6, 9, 10], over formal probabilistic logic programming [26, 4, 28], to cognitive robotics [7, 1, 2]. Recently, I have also started exploring neuro-symbolic techniques in order to combine symbolic and subsymbolic representations of the world [3, 16].

Volunteering

I have participated in the Summer School of Science in Croatia as a project leader. The summer school is a ten day event during which a small group of high school students works out their own research project and present their research to peers. I have had the opportunity to supervise two such projects (2017, 2018).
